

Custom Software Developer — Trial Task

A short, free build project | digitalheroesco.com

This trial is 100% free — ₹0 / \$0. Every tool below has a free tier that is more than enough. You will not pay a single cent anywhere.

Why we're giving you this task

CVs and old links don't show us what we actually need to know: can you follow instructions exactly, use modern AI development tools, and ship a working, useful product on your own? This trial answers that. It's small, it's free, and it goes straight into your portfolio either way. Do it well and we reach back to you with the next step.

The task

Build and deploy one useful free online tool — something you have personally used at least once in your own life and wished was simpler, faster, or free.

- Small or big — your choice. A clean small tool that works beats a big one that's half-broken.
- It must actually work and produce real output. Not a mockup, not a “coming soon” page.
- Pick something genuinely useful to you — not just a copy of the first idea you find.

Idea starters

Don't just pick the easiest — pick what's real for you: invoice / GST calculator, EMI or loan calculator, image compressor, PDF merger, QR code generator, unit / currency converter, split-the-bill calculator, resume builder, meta-tag generator, JSON formatter, password generator, age calculator, word & character counter, color palette generator.

Tools you will use (all free)

- 1 Google Antigravity — Google's free AI coding IDE. Download it, sign in with a normal Google account (free). Inside Antigravity, select the Claude model to build with — Claude Sonnet 4.6 and Opus 4.6 are available free in the public preview, no Anthropic account needed. Use Claude inside Antigravity to plan and build the whole tool.
- 2 GitHub — free account, to host your code and connect it to Vercel.
- 3 Vercel — deploy your tool live on the free Hobby plan. No card, no upgrade.

Any stack that deploys on Vercel is fine — Next.js, React, or plain HTML/CSS/JS.

IMPORTANT — do not buy any subscription. Not Antigravity / Google, not Vercel, not anything. If something is asking you to pay, you're on the wrong path — there is a free way to do every part of this. Spending money on this task is treated as not following instructions.

Mandatory requirements — we check every single one

- 1 The tool works and gives correct output.
- 2 A button labelled exactly “Built for Digital Heroes” that links to <https://digitalheroesco.com>
- 3 Your full name and email clearly visible on the page (real and reachable — this is how we contact you).
- 4 Live and deployed on Vercel’s free plan. Send us the live URL.
- 5 Public GitHub repo link to your code.
- 6 Add this project to your own portfolio.
- 7 ₹0 spent. No paid subscriptions used anywhere in the process.

How to submit

Send everything in a single reply. Incomplete submissions won’t be reviewed.

- Live tool URL (Vercel)
- GitHub repo link (public)
- Your full name + email
- One line: what the tool is, and when/why you’ve personally used something like it
- Portfolio link showing this project added

What happens next

We verify everything end to end — we open the live tool, test that it produces real output, check the button and link, and confirm it’s deployed for free. If the tool is genuinely useful, works correctly, and every requirement above is met, we reach back to you directly.

Deadline: within [X] days of receiving this task.
